ES/RP 531 Fundamentals of Environmental Toxicology

Lecture 24 Biomarkers & Contaminant Residues

Use of Biomarkers

- Biochemical, physiological, or histological indicators of either exposure to or effects of contaminants (or even natural products) at the suborganismal or organismal level of organization
- Generally measure sublethal effects in live organisms at the time of collection
- Specific and non-specific for contaminants
- May only be indicative of exposure, not an adverse effect
- Must overcome problems related to within population variability and between population variability

Examples of Biomarkers

- Enzymes
 - AChE (acetylcholinesterase)
 - Cyt P4501A1 (a.k.a. aryl hydrocarbon hydroxylase)
 - Use of EROD assay to determine level of induction of P4501A1 by Ah receptor agonists
 - ALAD (delta-aminolevulinic acid dehydratase)
 - Inhibited activity may be indicative of lead exposure (applicable to animals with hemoglobin or other heme-containing biomolecules)
 - ATPase
 - Plant enzymes (peroxidase; RUBISCO)

Examples of Biomarkers

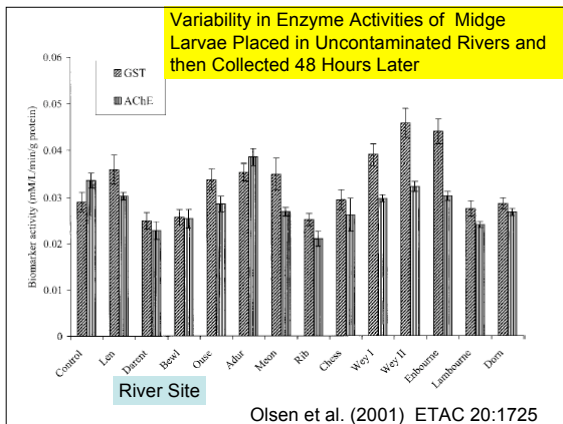

- Energetics
 - Adenylate energy charge
 - Energy reserves
 - Whole body calorimetry
 - Enzymes of intermediary metabolism
 - Growth

Examples of Biomarkers

- Endocrine
 - Hormone levels
 - Protein synthesis under endocrine control
 - For ex., vitellogenin
- Blood chemistry
- Growth Rate
 - RNA and protein synthesis

Use of Biomarkers

- Biochemical, physiological, or histological indicators of either exposure to or effects of contaminants (or even natural products) at the suborganismal or organismal level of organization
- Generally measure sublethal effects in live organisms at the time of collection
- Specific and non-specific for contaminants
- May only be indicative of exposure, not an adverse effect
- Must overcome problems related to within population variability and between population variability
- Must understand how environmental conditions during development affects biomarker response

Comparison of AChE Activity (nmol/min/mg) in Frogs from Sierra Nevada and California Coastal Sites

Population Origin	Rearing Temperature @ 8°C	Rearing Temperature @ 19°C
Coastal CA	28.2 ± 10.2	38.7 ± 11.2
Sierras	26.4 ± 9.9	42.3 ± 17.3

Johnson et al. (2005) Environ. Toxicol. Chem. 24:2074

“Residues”

- Residues refer to chemical contaminants in the physical environment and in biological tissues
 - The constituents of chemical products (or formulations) become residues when they are dispersed into the environment

Residue Amount

- Expressed as a concentration
 - Unit of mass per volume or surface area
 - Milligrams per Liter (mg/L) (or per square meter)
 - Micrograms per milliliter (µg/mL) (or per sq. cm)
 - A proportion
 - 1% (1 part per 100)
 - 0.0001% (1 part per million)
 - A molar quantity
 - Moles/L (if in solution)
 - One mole = the molecular weight of a substance in grams
 - 1 µmol = the molecular weight in micrograms

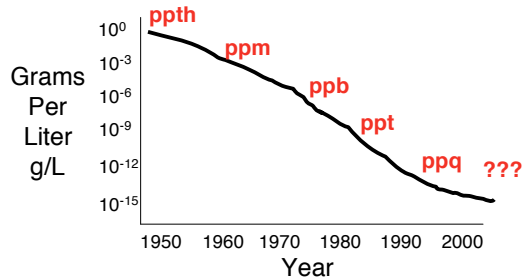

What Does It Mean?

- Usual range of detections many environmental contaminants ranges from ppt (parts per trillion) - ppb (parts per billion)
 - From the perspective of purity, that translates to
 - 99.999999999% -- 99.9999999%
 - I.e., if 1 ppb = 0.0000001%, then 100% - 0.0000001% yields 99.9999999%

**99.4% Pure
!!!!!!!**

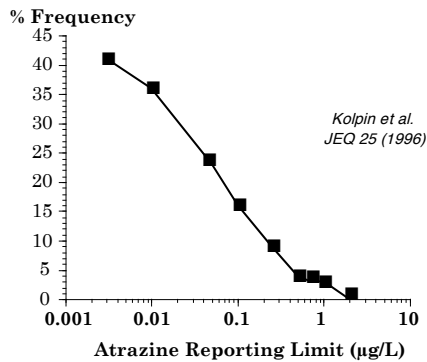

Analytical Technology Has Advanced Faster Than Biological Understanding

Consequences of Increased Analytical Capability

- Contaminant residues are in places we would never expect to see them
- Contaminant residues seem to be everywhere
- Tendency to want to lower regulatory standards to the level of detectability

Frequency of Atrazine Detection in Shallow Aquifers Increases as Reporting Limit Decreases

Pesticide Residues-- Frequencies/Identities/Concentrations

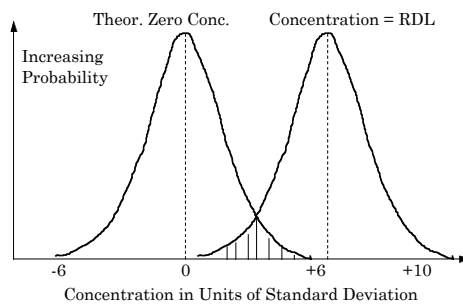

Relevant Questions

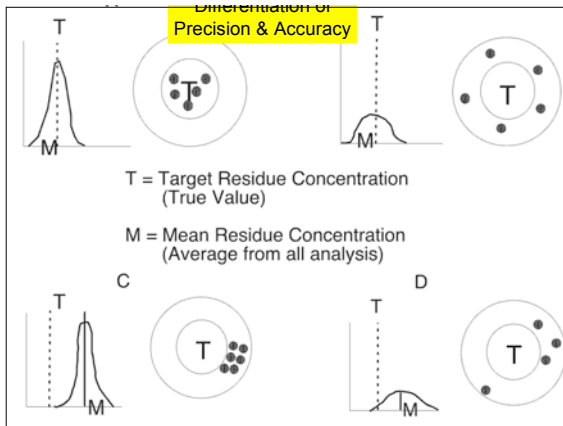

- Method Detection Limit
- Method Quantitation Limit
- Concentrations
 - > means
 - > medians
 - > geometric mean
 - > percentiles

Reliable Data Decisions

Possible Decisions:	Analyte Not Present	Analyte Present
Detected	Incorrect Decision False Positive (Type I Error)	Correct Decision
Not Detected	Correct Decision	Incorrect Decision False Negative (Type II Error)

Probability Density Functions (Distribution of the Residue Values in Repeated Analyses)

Monitoring Programs

Monitoring Programs

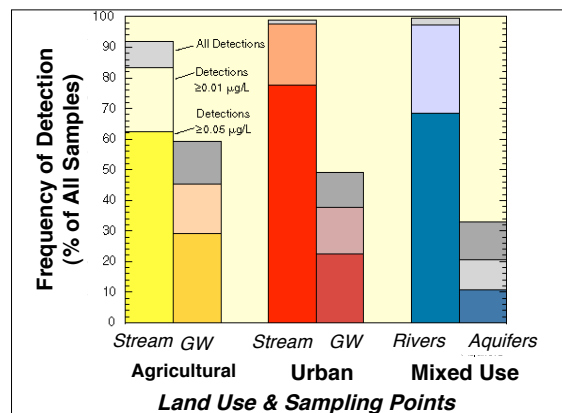

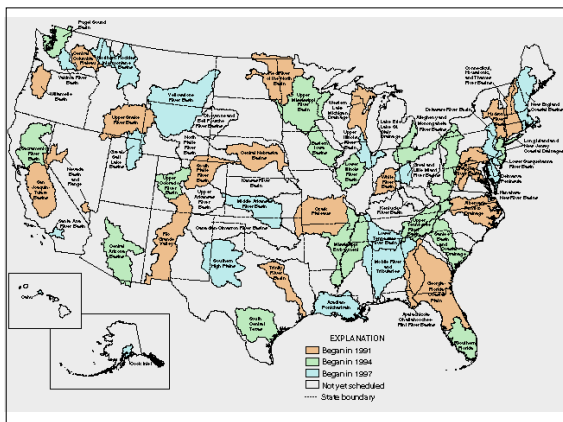

- USGS NAWQA (National Water Quality Assessment Program)
- State Water Quality Monitoring Programs
 - Under mandate by the Clean Water Act
 - Potable water under mandate of the Safe Drinking Water Act

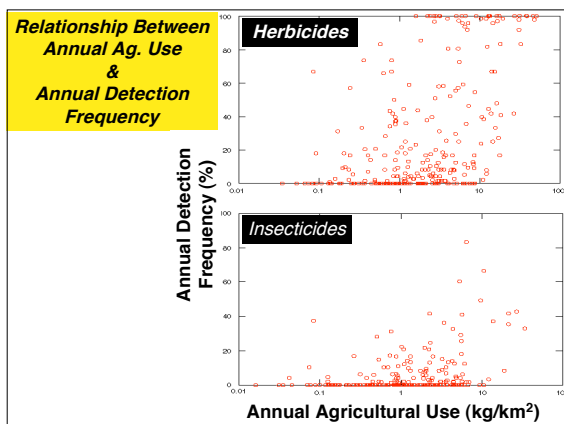

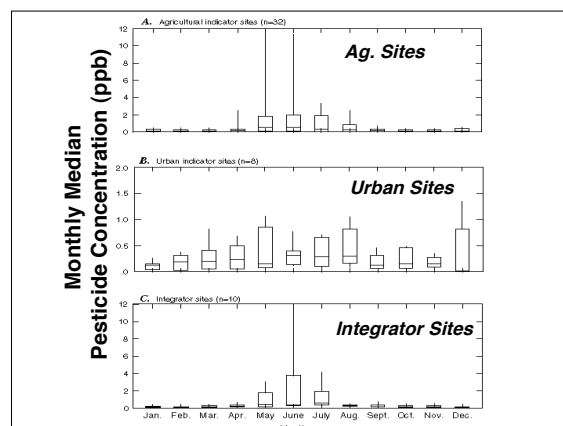

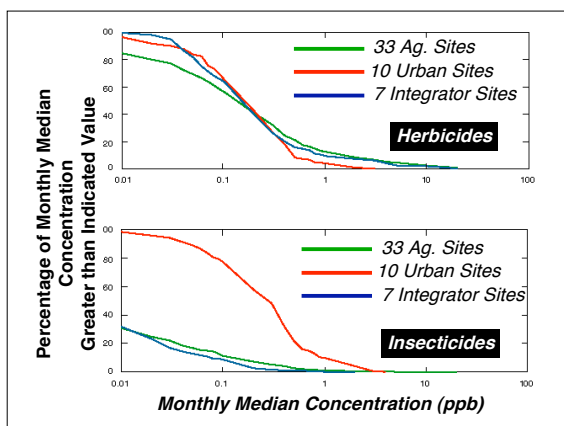

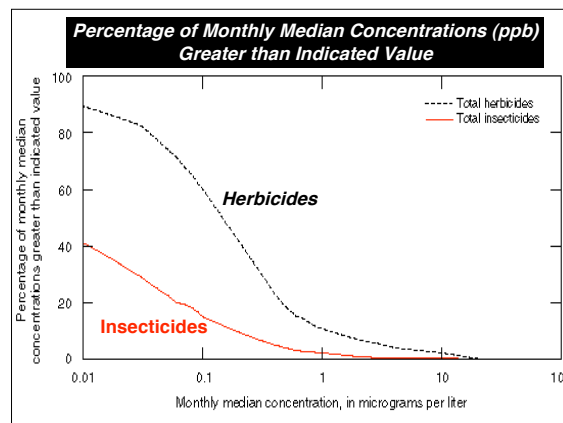

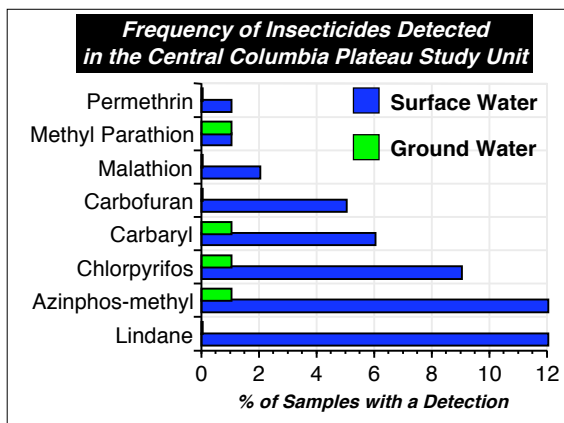

USGS NAWQA Program

- Goal
 - Help support the development and evaluation of management, regulatory, and monitoring decisions by other Federal, State, and local agencies to protect, use, and enhance water resources

USGS NAWQA Program

- Implementation
 - Investigations at 60 of the most important river basins and aquifer systems (aka study units)
 - Represent a diversity of hydrogeologic conditions
 - ~70% of U.S. freshwater use occurs within the study units

Active ingredient and trade name¹ example in parentheses

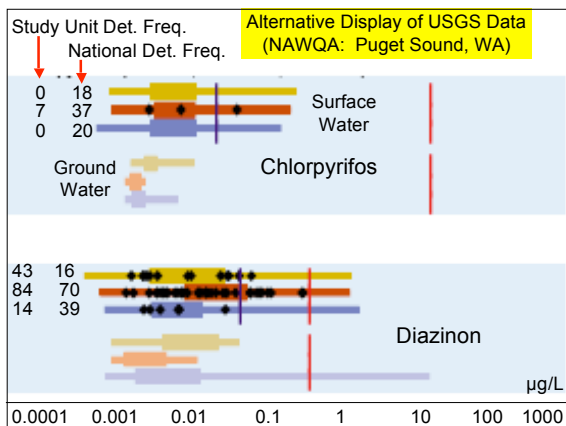

Freshwater aquatic-life criteria, in parts per billion

Concentration, in parts per billion (ppb)

Legend: 1. AM, commercial maximum application; 2. AM, commercial maximum application; 3. AM, commercial maximum application

Herbicide	Acute	Chronic	HMC	0.001	0.01	0.1	1	10	100
2,4-D (Weedone)	10	1	1	1	1	1	1	1	1
Acetochlor (Guardian)	10	1	1	1	1	1	1	1	1
Atrazine (Aatrex)	10	1	1	1	1	1	1	1	1
Bromoxynil (Bramox)	100	10	1	1	1	1	1	1	1
Dichlorprop (Dactron)	10	1	1	1	1	1	1	1	1
Dichlorprop (2,4-DP)	10	1	1	1	1	1	1	1	1
EPTC (Eptam)	10	1	1	1	1	1	1	1	1
